The increase of cost efficient biomass heating is an interesting option for the region. Many municipalities still have large numbers of oil boilers installed, which could easily be replaced by e.g. pellet boilers or biomass district heating. Due to this background biomass district heating- and CHP-plants are analyzed (location, size) and mapped. This is done to match the (known) heating demand with the current supply for biomass district heating and to analyze the further development of (cost efficient) biomass district heating.
